Handbook and Manual pages

- Official guide and be found at
  - https://www.freebsd.org/doc/en/books/handbook/permissions.html

Files

- $ ls -l

```
drwx--x--x  7 tsaimh  dcs      1024 Sep 22 17:25 public_html
```

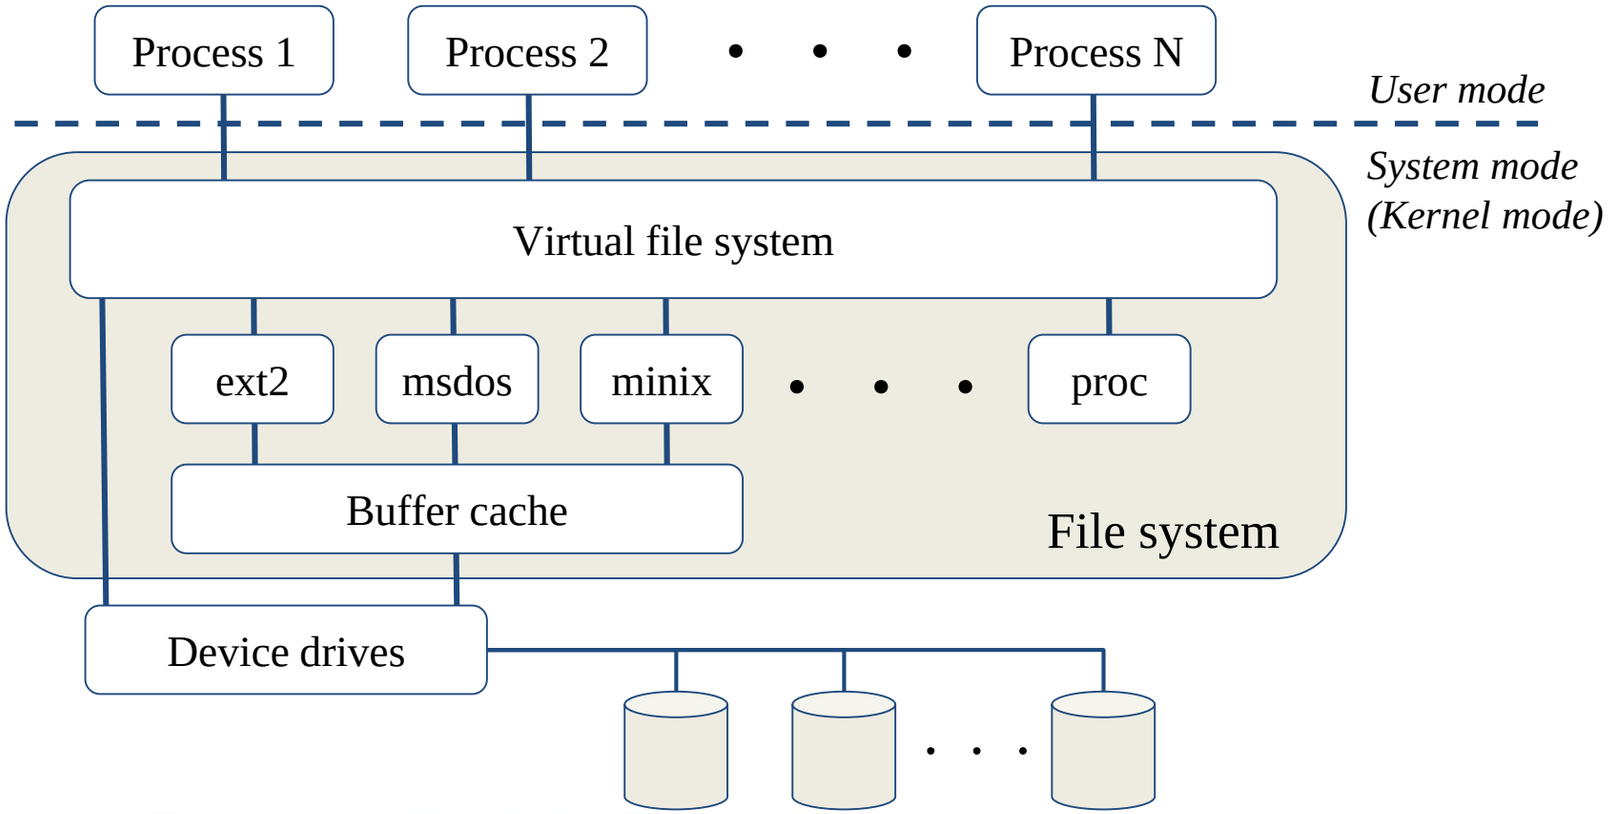
File Type	d
File Access Mode	rwx--x--x
Number of links	7
File User Owner	tsaimh
File Group Owner	dcs
File Size	1024
File Last Modify Time	Sep 22 17:25
File Name	public_html

Outline

- File System Architecture
  - Pathname
  - File Tree
  - Mounting
  - File Types
- inode and file
  - Link
- File Access Mode
  - Changing File Owner
  - FreeBSD bonus flags

File System Architecture (1)

- Application ↔ Kernel ↔ Hardware
  - Applications call system-calls to request service
  - Kernel invokes corresponding drivers to fulfill this service



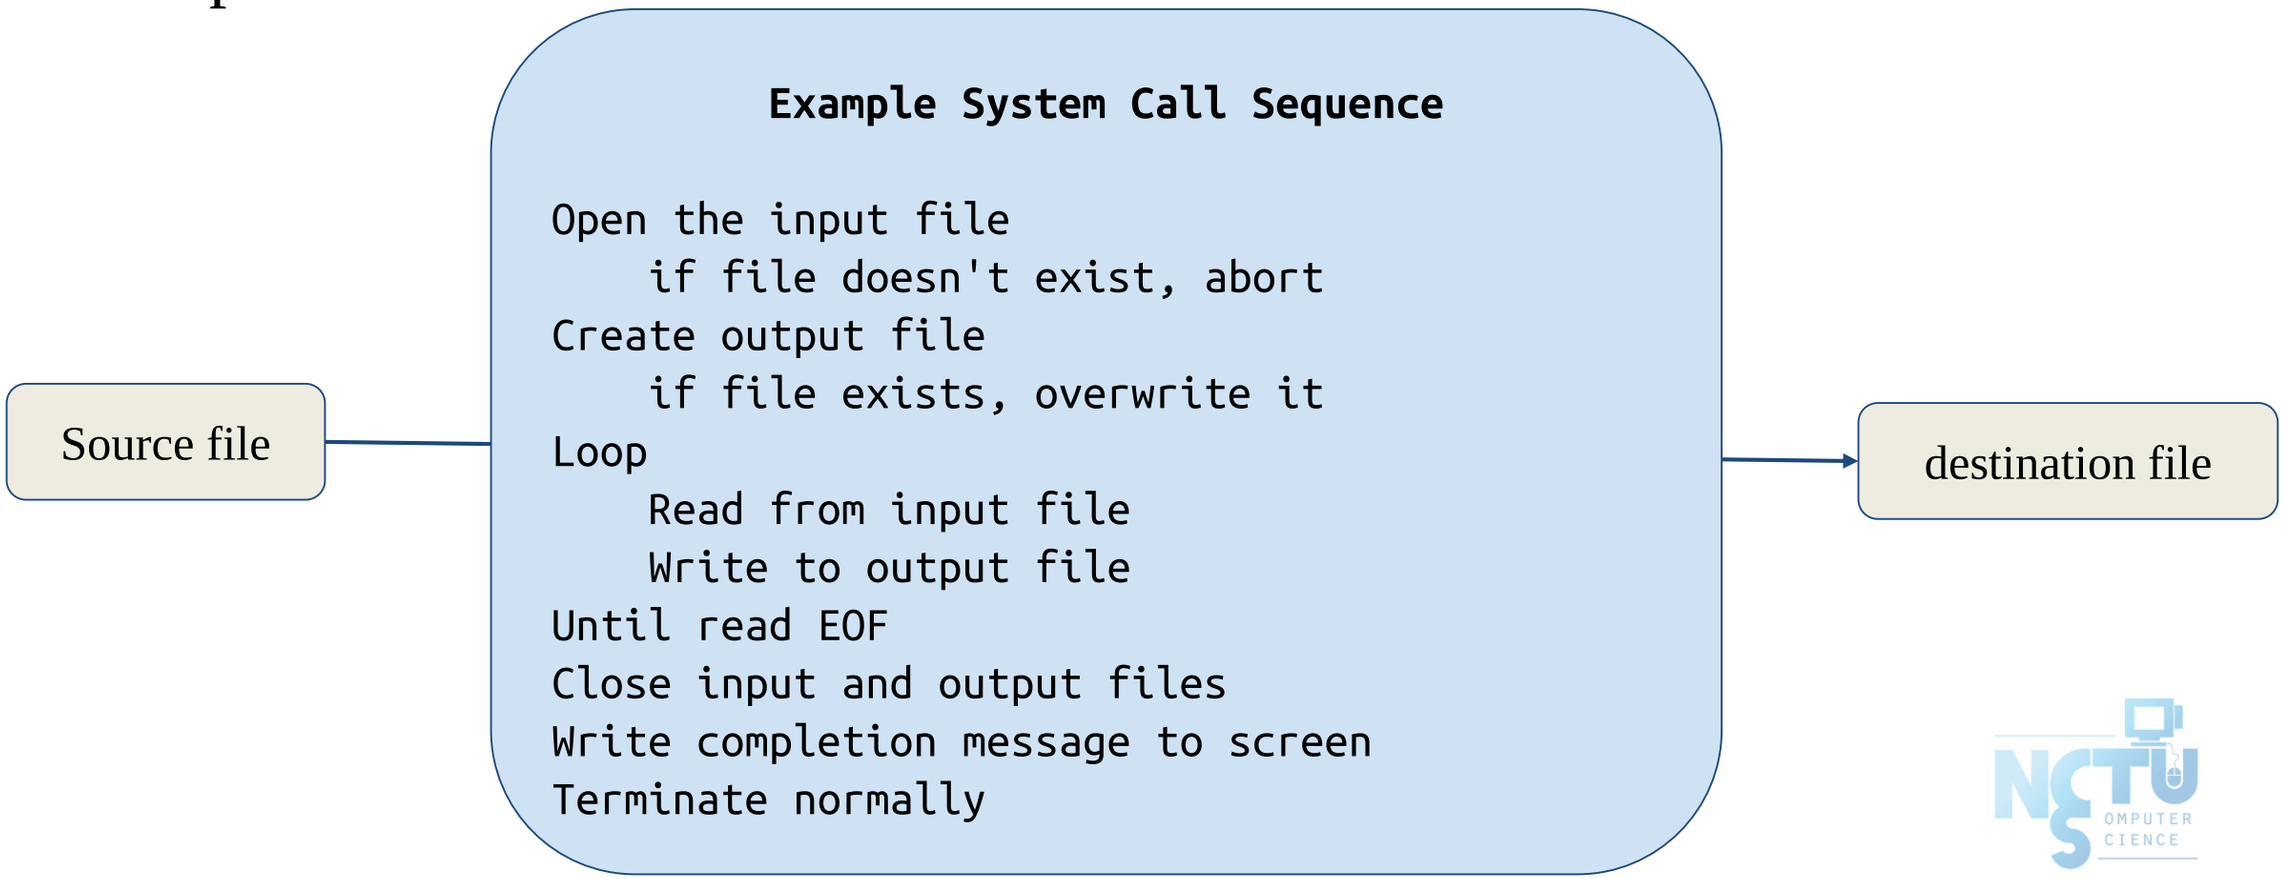
File System Architecture (2)

- The basic purpose of filesystem
  - Represent and organize the system's storage
  - Four main components:
    - Namespace
      - A way of naming things and arranging them in a hierarchy
    - Application Programming Interface (API)
      - A set of system calls for navigating and manipulating nodes
    - Security model
      - A scheme for protecting, hiding and sharing things
    - Implementation
      - Code that ties the logical model to an actual disk

File System Architecture (3)

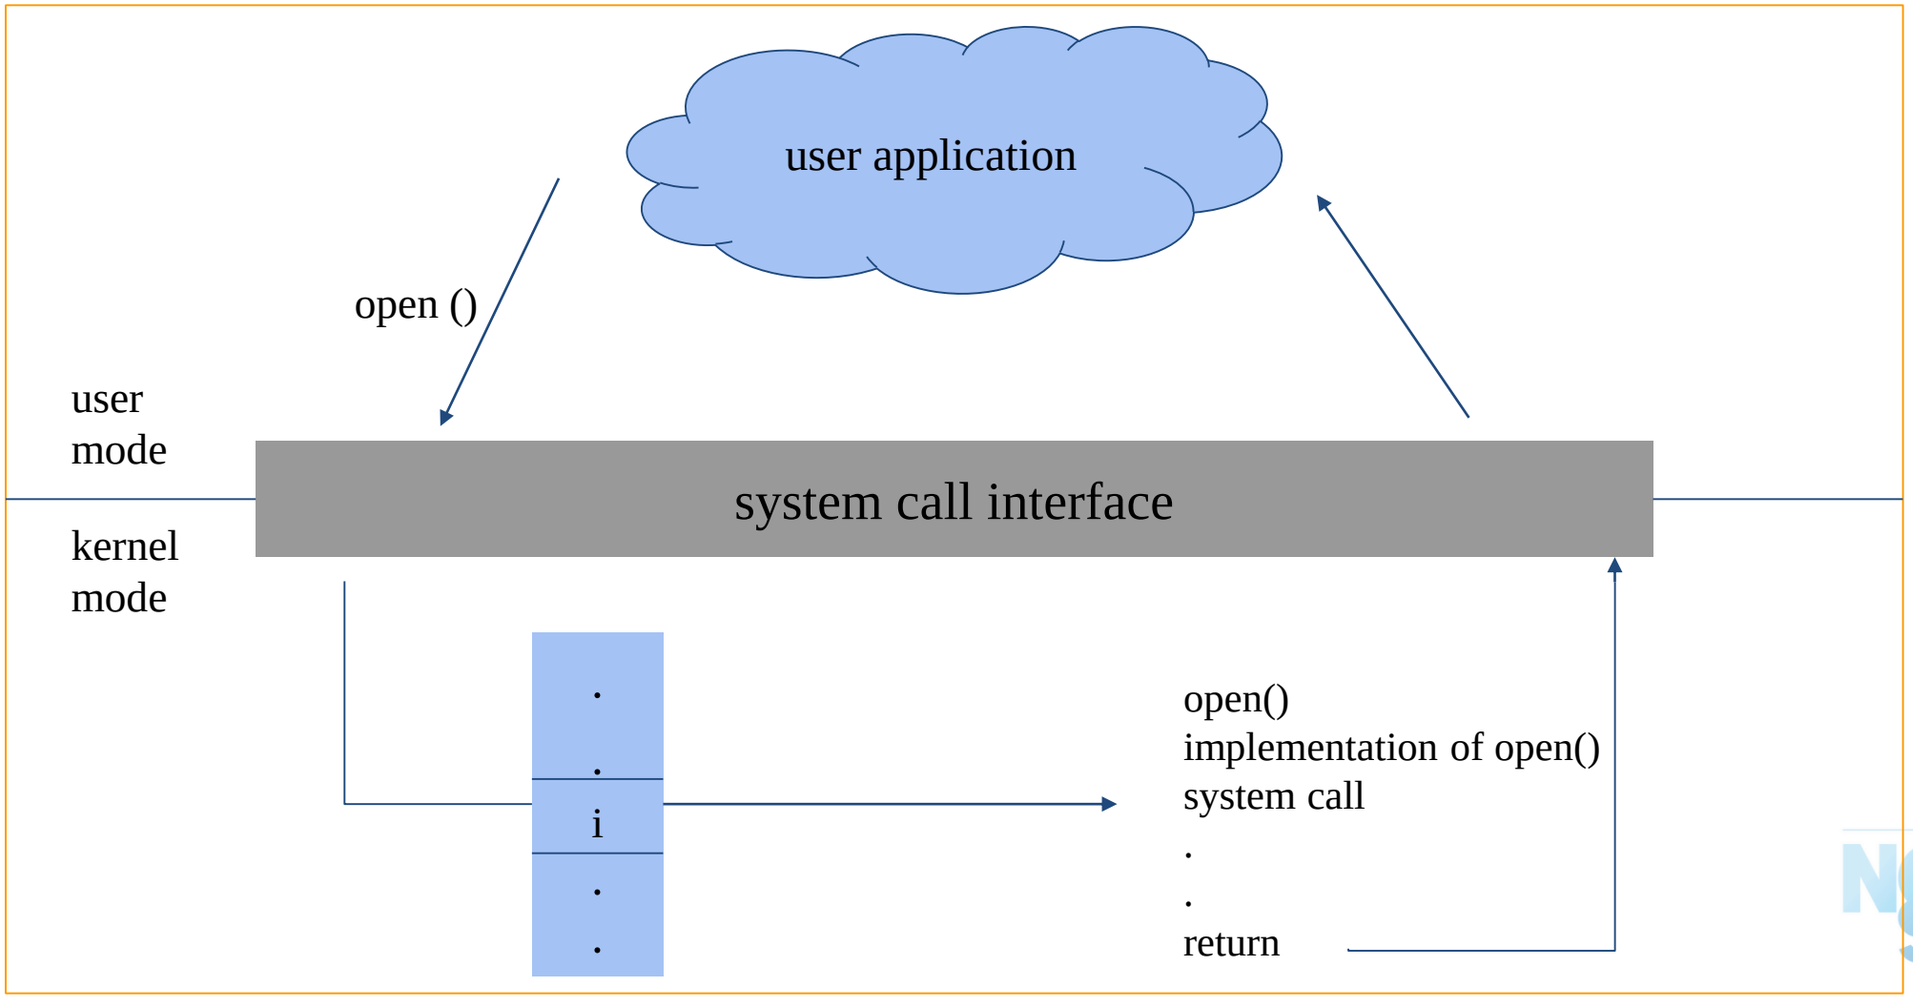
- System call sequence to copy the contents of one file to another file

  $ cp file1 file2



File System Architecture (4)

- API – System Call – OS Relationship



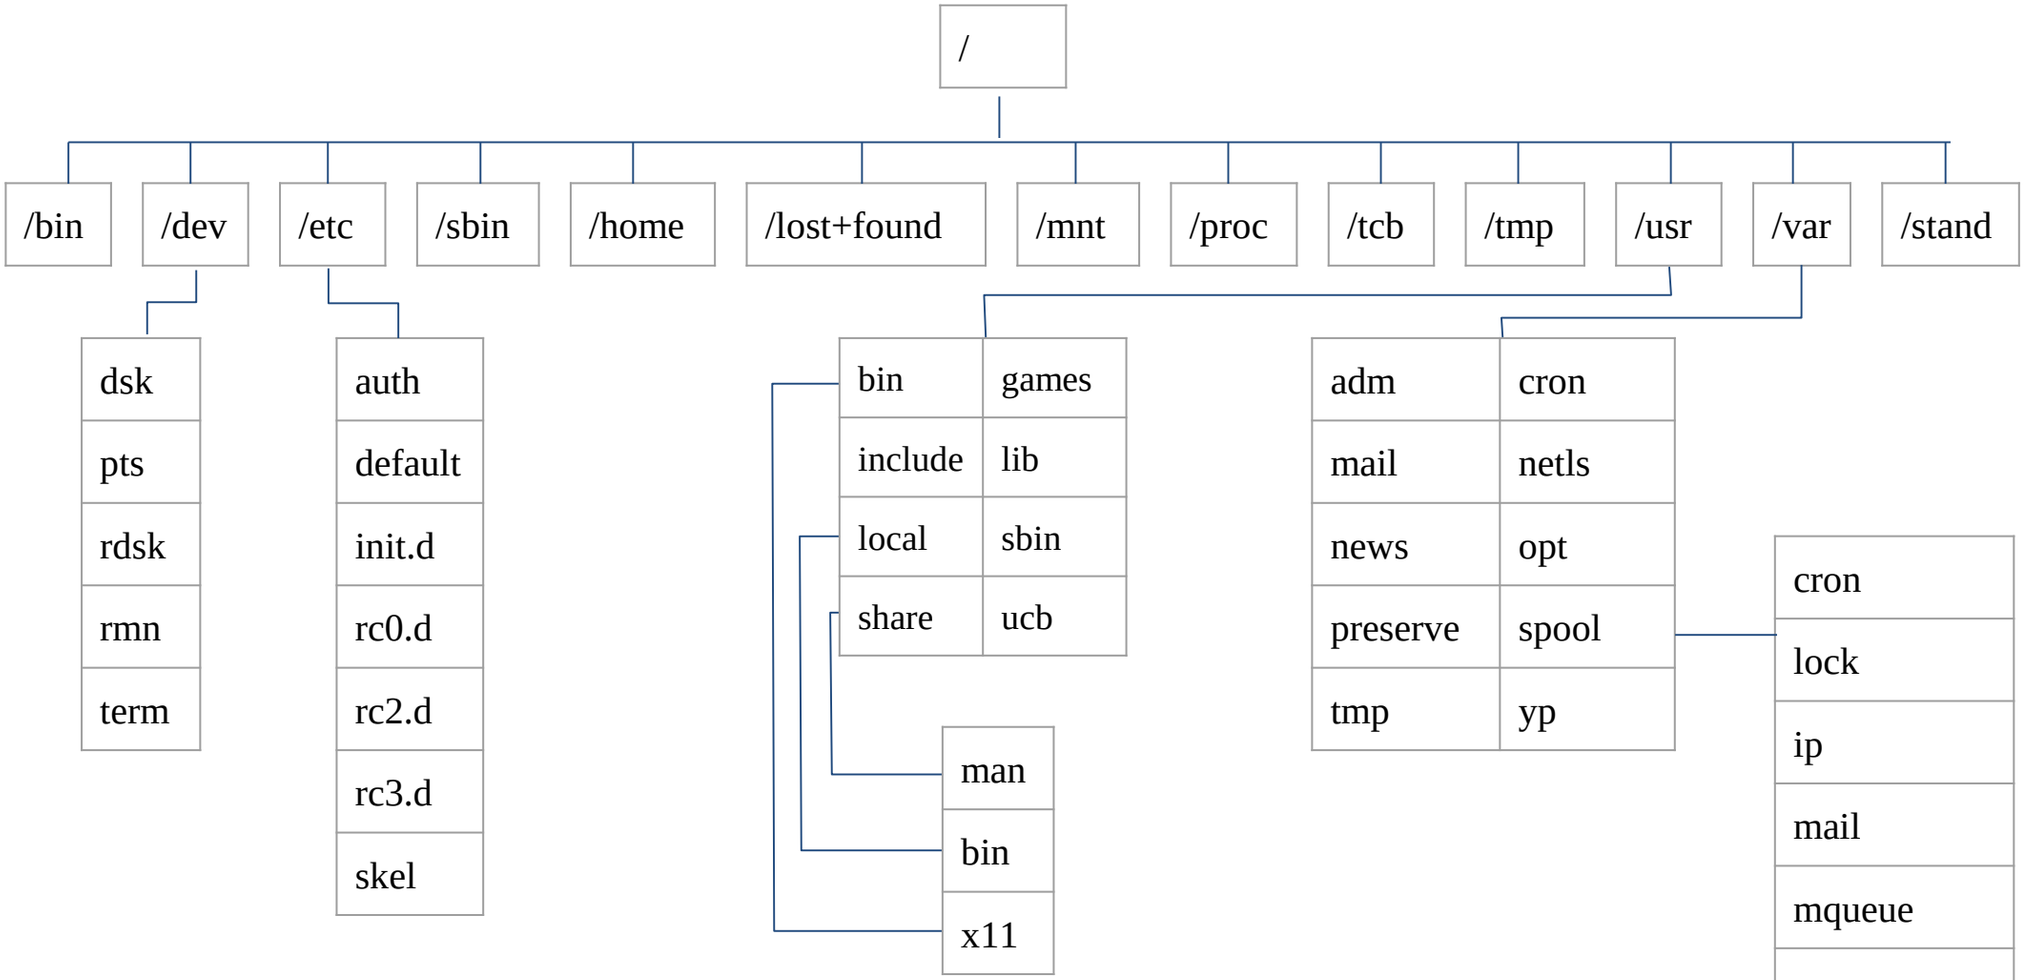
File System Architecture (5)

- Objects in the filesystem:
  - What you can find in a filesystem:
    - Files and directories
    - Hardware device files
    - Processes information
    - Inter-process communication channel (IPC)
    - Shared memory segments (SHM)
  - We can use common file system interface to access such "object"
    - open、read、write、close、seek、ioctl, fcntl, …

Pathname

- Two kinds of path
  - Absolute path → start from /
    - E.g. /net/dcs/93/9317807/test/haha.c
  - Relative path → start from your current directory
    - E.g. test/haha.c
- Constraints of pathname
  - Single component: ≦ 255 characters
  - Single absolute path: ≦ 1023 characters

File Tree



/
/bin
/dev
/etc
/sbin
/home
/lost+found
/mnt
/proc
/tcb
/tmp
/usr
/var
/stand
dsk
pts
rdsk
rmn
term
auth
default
init.d
rc0.d
rc2.d
rc3.d
skel
bin
include
local
share
games
lib
sbin
ucb
man
bin
x11
adm
mail
news
preserve
tmp
cron
netls
opt
spool
yp
cron
lock
ip
mail
mqueue
uucp
uucppublic

Layout of File Systems (1)

- hier(7)

Path Name	Contents
/	The root directory of the file system
/bin & /sbin	User utilities & system programs fundamental to both single-user and multi-user environments
/usr	User utilities and applications
/usr/bin & /usr/sbin	Local executable
/lib	Shared and archive libraries
/libexec	Critical system utilities needed for binaries in /bin and /sbin
/mnt	Empty directory commonly used by system administrators as a temporary mount point
/tmp	Temporary files that are not guaranteed to persist across system reboots. Also, there is /var/tmp
/usr/lib	Support libraries for standard UNIX programs
/usr/libexec	System daemons & system utilities (executed by other programs)
/usr/include	Libraries Header files
/usr/local	Local executables, libraries, etc

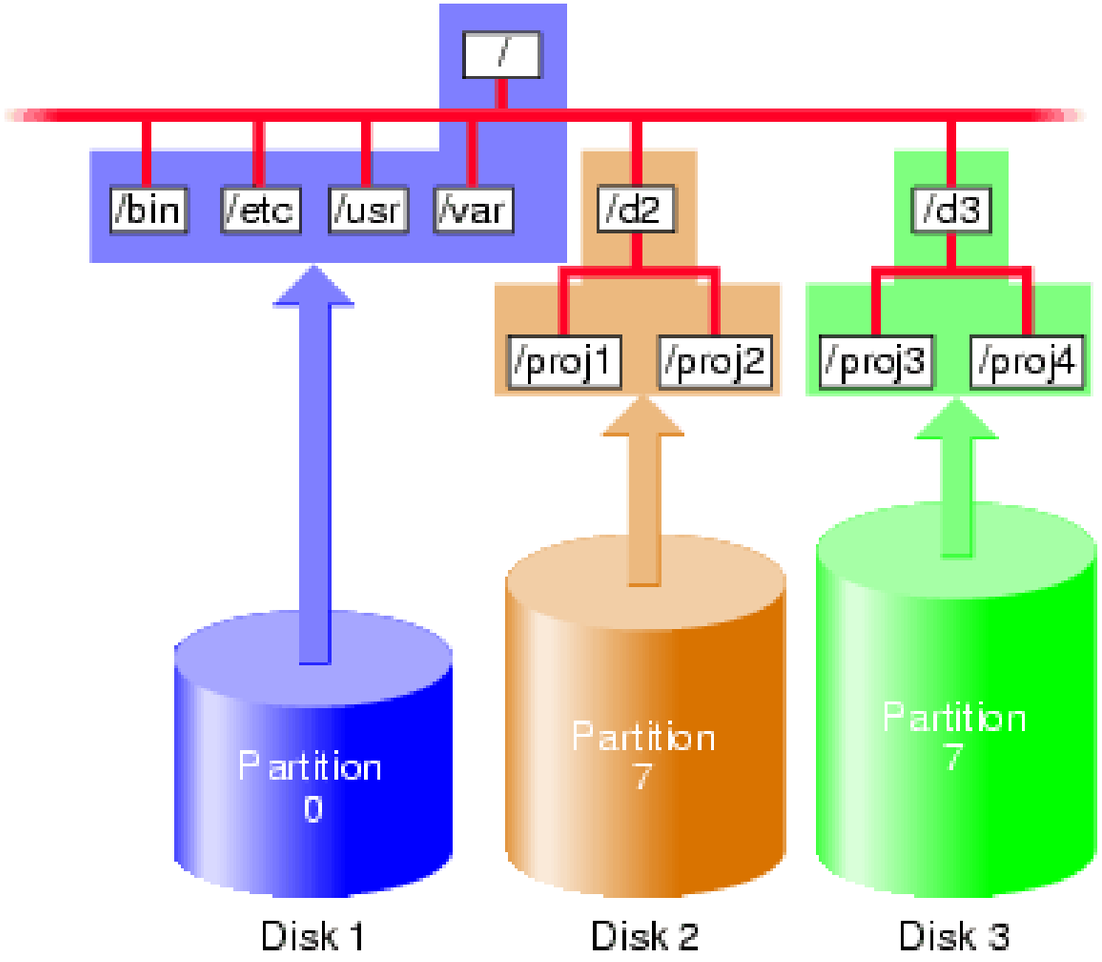
Layout of File Systems (2)

Path Name	Contents
/usr/src	BSD, third-party, and/or local source files
/usr/obj	Architecture-specific target tree produced by building the /usr/src tree
/etc	System configuration files and scripts
/usr/local/etc	/etc of /usr/local, mimics /etc
/dev	Device entries for disks, terminals, modems, etc
/proc	Images of all running process
/var	Multi-purpose log, temporary, transient, and spool files
/var/db	Database files
/var/db/pkg & /var/db/ports	Ports Collection management files. ports(7)
/var/log	Various system log files
/var/mail	User mailbox files
/var/spool	Spooling directories for printers, mails, etc

Mounting file system (1)

- mount(8)
- Common types of file systems
  - Most are disk partitions
  - Network file servers
  - Memory disk emulators
  - Kernel components
  - Etc,…
- "mount" command
  - Map the mount point of the existing file tree to the root of the newly attached filesystem
  - $ mount /dev/ad2s1e /home2
  - The previous contents of the mount point become inaccessible

Mounting file system (2)



Mounting file system (3)

- fstab(5)
- Filesystem table – fstab
  - Automatically mounted at boot time
  - /etc/fstab
    - Filesystem in this file will be checked and mounted automatically at boot time

    E.g.

```
# Device      Mountpoint    FStype  Options      Dump    Pass#
/dev/ad0s1a   /             ufs     rw           1       1
/dev/ad0s1b   none          swap    sw           0       0
```

Mounting file system (4)

- umount(8)
- Unmounting file system
  - "umount" command
    - $ umount { node | device }
      - Ex:

umount /home	umount /dev/ad0s1e

  - Busy file system
    - Someone’s current directory is there or there are opened files
    - Use "umount -f"
    - We can use "lsof" or "fstat" like utilities to figure out who makes it busy

Mounting file system (5)

- fstat(1)

```
$ fstat
USER     CMD        PID      FD  MOUNT      INUM    MODE         SZ|DV     R/W
tsaimh   fstat      94218    wd  /          234933  drwxr-xr-x   16          r
root     screen     87838    4   /tmp       9947    prwx------   0           r
```

- lsof(8) (/usr/ports/sysutils/lsof) – list open files

```
$ lsof
COMMAND    PID   USER     FD    TYPE  SIZE/OFF    NODE    NAME
screen     87838 root     cwd   VDIR         7     522069  /usr/ports/sysutils/screen
screen     87838 root     rtd   VDIR        26          3  /
screen     87838 root     txt   VREG    337968     424757  /usr/local/bin/screen
screen     87838 root     txt   VREG    245976     679260  /libexec/ld-elf.so.1
screen     87838 root     txt   VREG    314504     678109  /lib/libncurses.so.8
screen     87838 root     txt   VREG     64952     678438  /lib/libutil.so.8
screen     87838 root     txt   VREG     33536     677963  /lib/libcrypt.so.5
```

File Types (1)

- File types

Symbol	File types
-	Regular file
b	Block device file
c	Character device file
d	Directory
l	Symbolic link
s	UNIX domain socket
p	Named pipe

File Types (2)

- file command
  - determine file type
    - $ file .tcshrc

      .tcshrc: ASCII text
    - $ file /bin

      /bin: directory
    - $ file /bin/sh

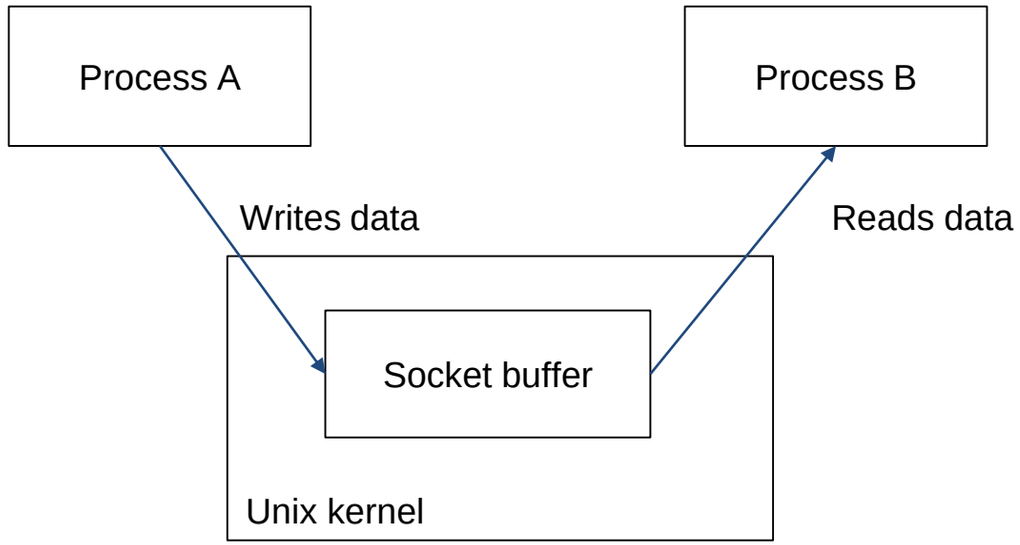
      /bin/sh: ELF 32-bit LSB executable, Intel 80386, version 1 (FreeBSD), dynamically linked (uses shared libs), stripped
  - /usr/ports/sysutils/file

File Types (3)

- Directory
  - . and ..
  - mkdir / rmdir

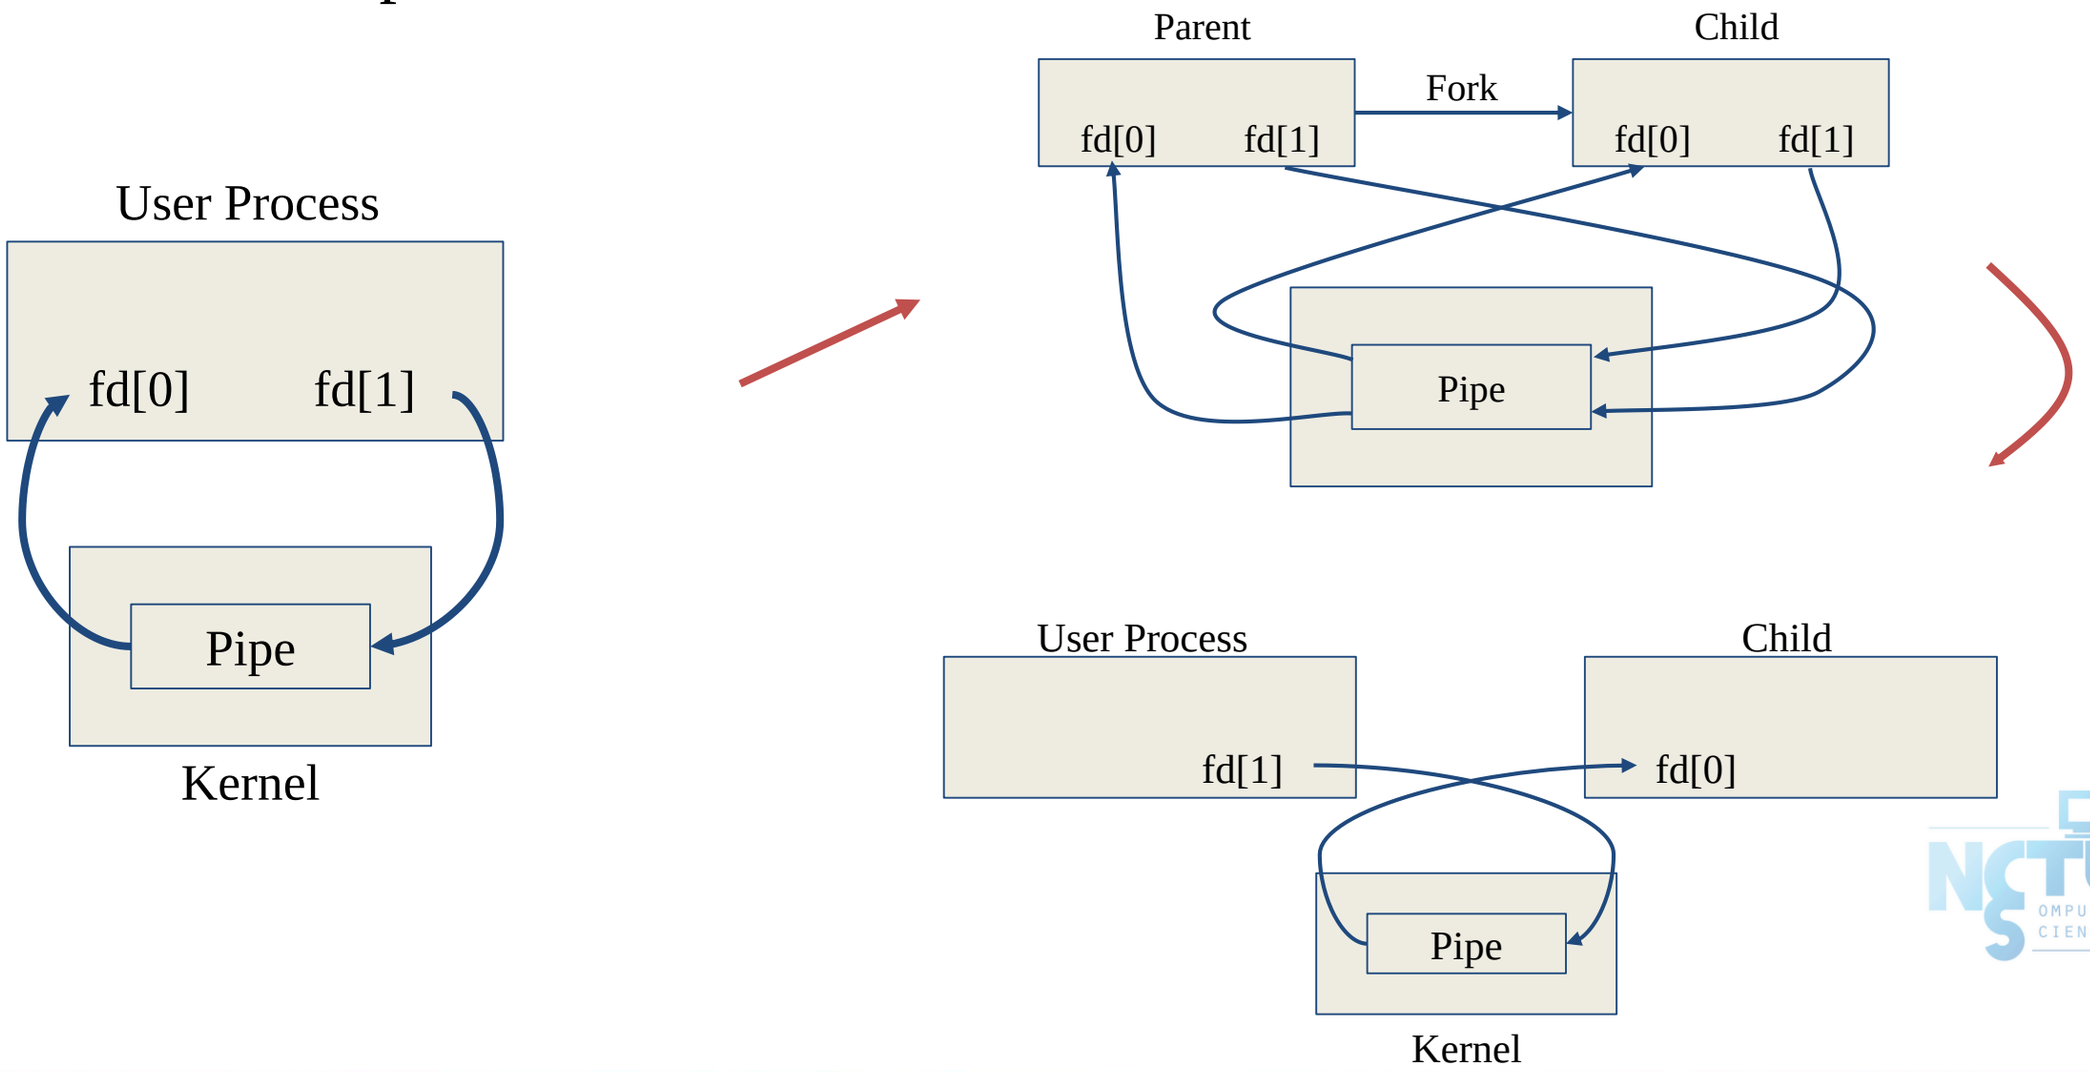
File Types (4)

- UNIX domain socket
  - Created by socket()
  - Local to a particular host
  - Be referenced through a filesystem object rather than a network port



File Types (5)

- Pipes
  - Let two processes do "FIFO" communication



File Types (6)

- Named Pipe
  - $ mkfifo [-m mode] fifo_name ...
  - $ mkfifo pipe
  - $ du >> pipe

  (another process)
  - $ sort -n pipe

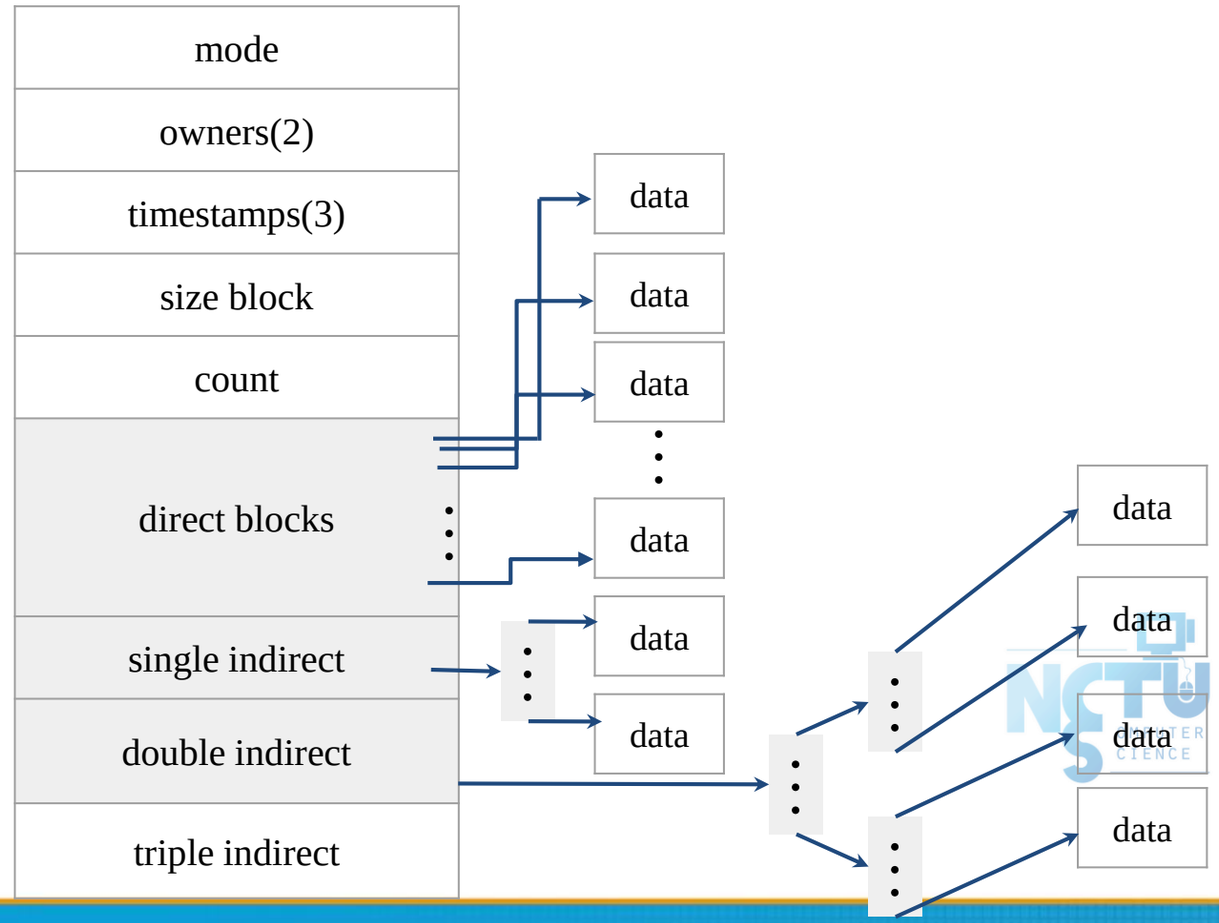
File Types (7)

- Symbolic Link
  - A file which points to another pathname
  - $ ln -s ori-file soft-file
  - Like "short-cut" in Windows

inode and file (1)

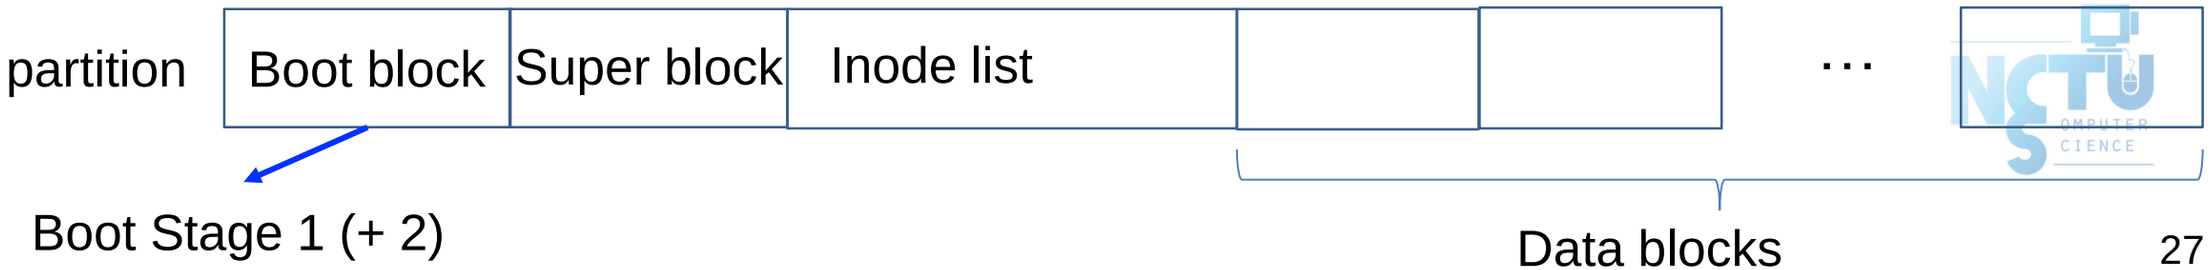
- inode
  - A structure that records information of a file
    - You can use "ls -i" to see each file's inode number

```
$ ls -i
```



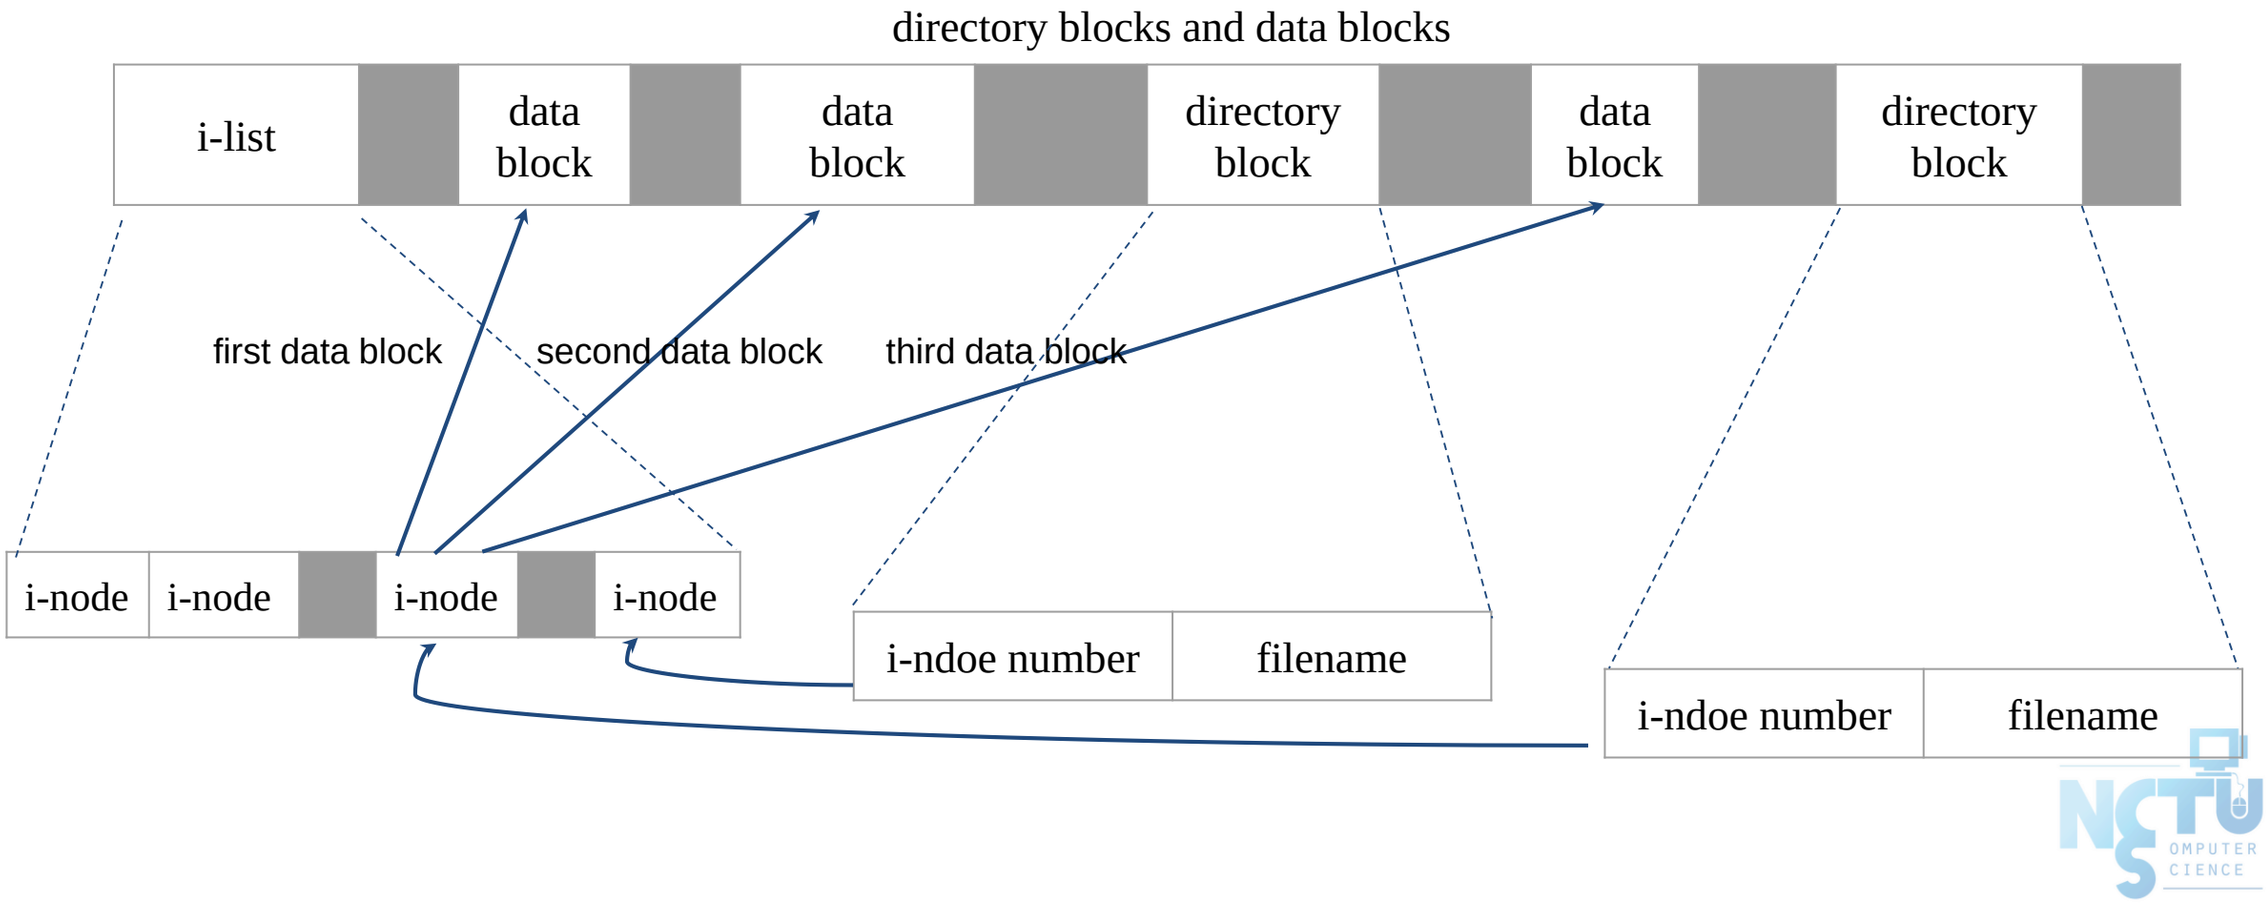
inode and file (2)

- A Unix partition consists of four major components:
  - The **boot block** contains the bootstrap program used to load the operating system.
  - The **super block** describes the state of the file system (e.g., total size of the partition, block size, inode number of the root directory)
  - **Inode list** contains a linear array of inodes. While users think of files in terms of file names, Unix thinks of files in terms of inodes.
  - **Data blocks** contain the actual contents of files.



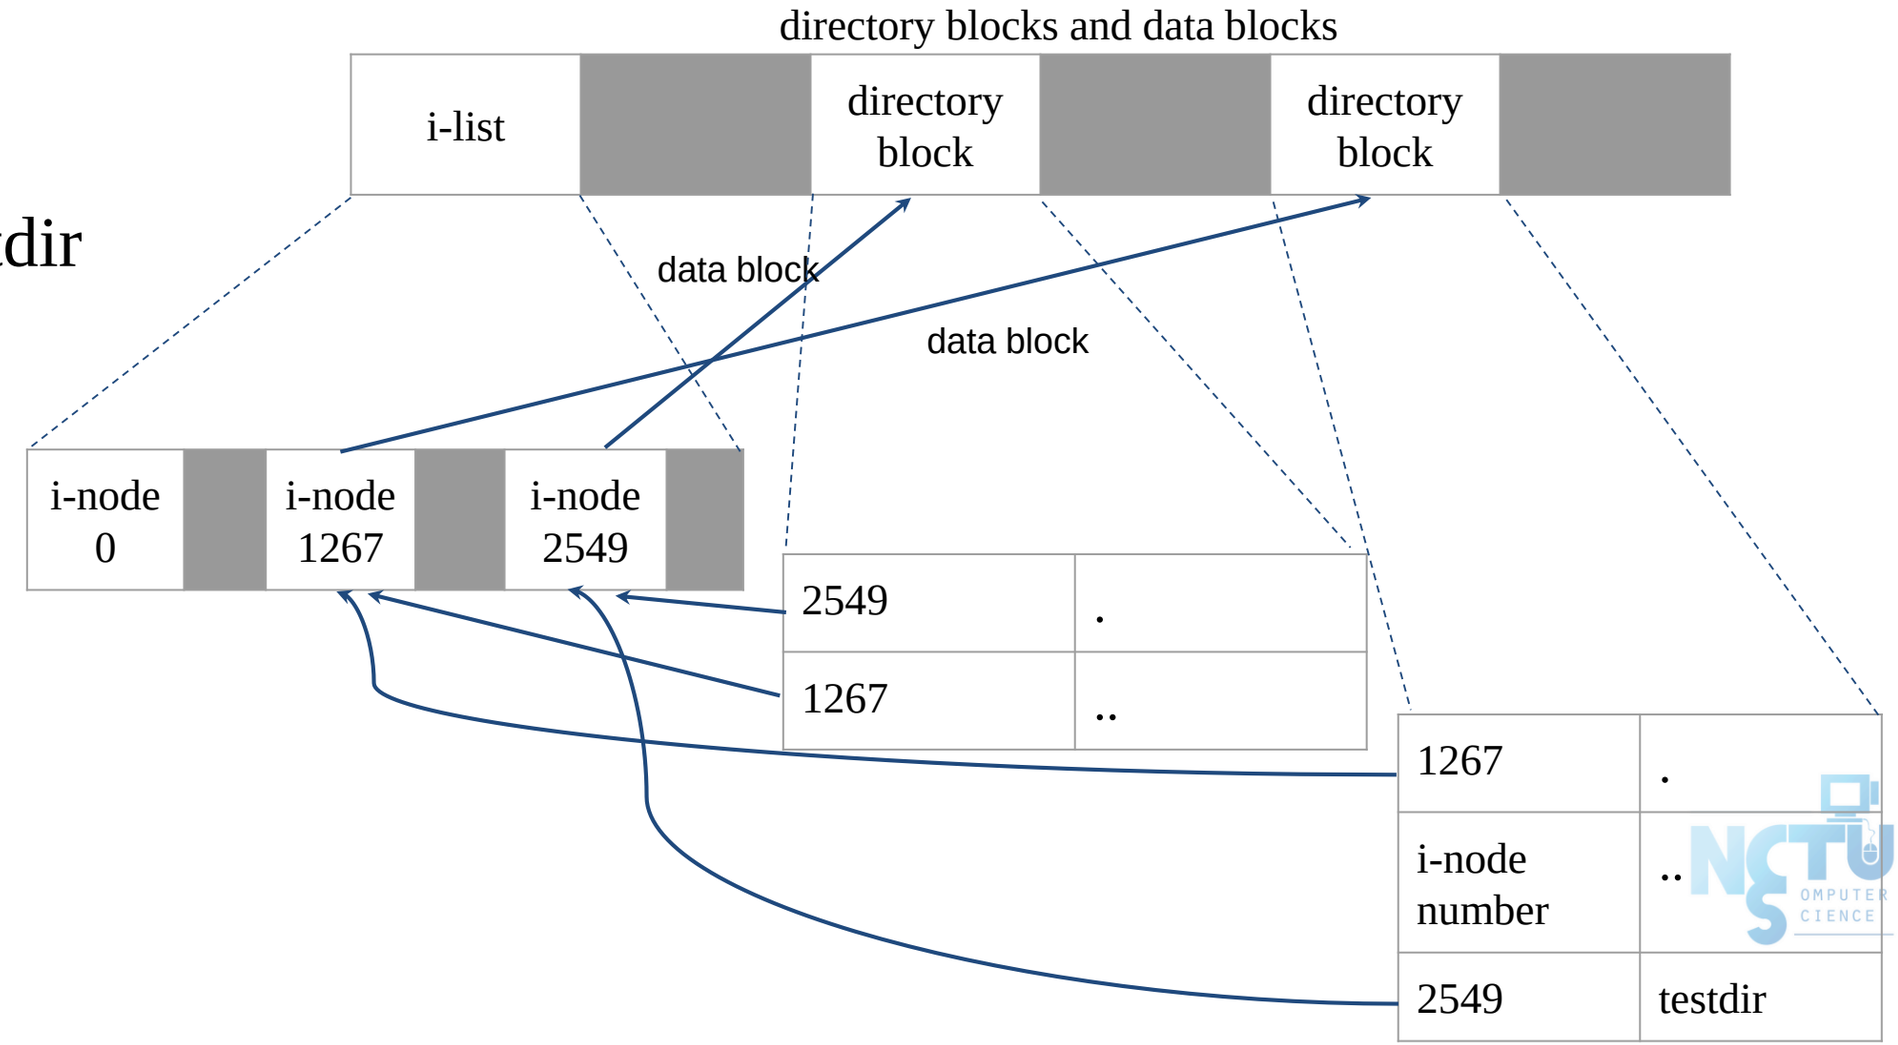
inode and file (3)

- More details of inode and data block



inode and file (4)

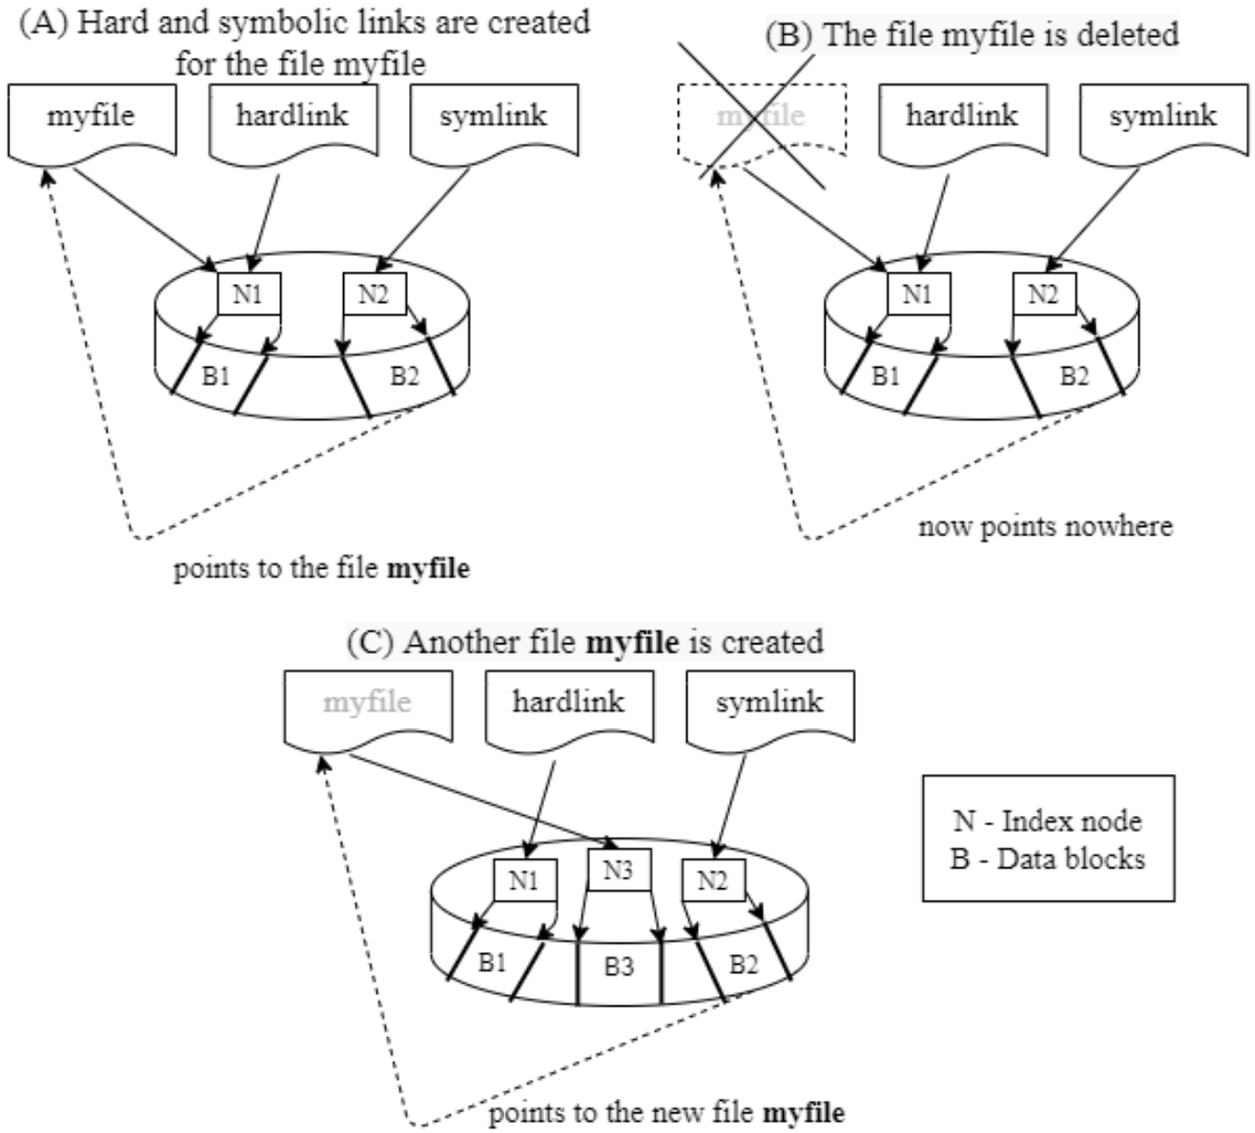
- Example
  - .
  - ..
  - testdir



Hard Link vs. Symbolic Link (1)

- Link
  - Hard link
    - Associate two or more filenames with the same inode
      - Must in the same partition
    - $ ln ori-file hard-file
  - Soft (symbolic) link
    - A file which points to another pathname
    - $ ln -s ori-file soft-file

Hard Link vs. Symbolic Link (2)



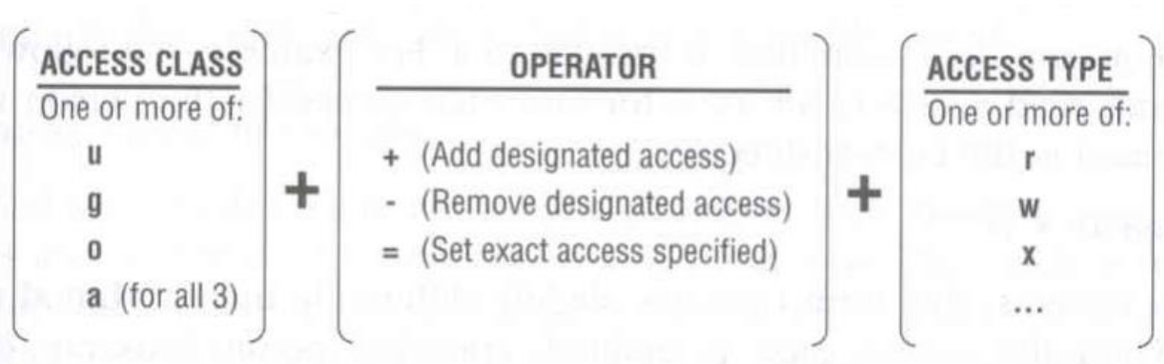
(A)
$ touch myfile
$ ln myfile hardlink
$ ln –s myfile symlink

(B)
$ rm myfile

(C)
$ touch myfile

File Access Mode (1)

- rwx r-x r-x
  - User, group, other privileges
- chmod command
  - chmod(1), "MODES" section
  - $ chmod access-string file
    - $ chmod u+x test.sh
    - $ chmod go-w .tcshrc
    - $ chmod u+w,g-w hehe haha
    - $ chmod –R 755 public_html/



File Access Mode (2)

- setuid, setgid, sticky bit
  - setuid, setgid on file
    - The effective uid/gid of resulting process will be set to the UID/GID of the file
    - setuid

      passwd, chsh, crontab
    - setgid

      write

File Access Mode (3)

- setgid on directory
  - Cause newly created files within the directory to be the same group as directory
- sticky on directory (/tmp)
  - Do not allow to delete or rename a file unless you are
    - The owner of the file
    - The owner of the directory
    - root

File Access Mode (4)

- Decimal argument of chmod
  - setuid: 4000
  - setgid: 2000
  - sticky : 1000

Mode	Attribute	Mode	Attribute
755	- rwx r-x r-x	644	- rw- r-- r--
4755	- rws r-x r-x	600	- rw- --- ---
2755	- rwx r-s r-x	444	- r-- r-- r--
2775	d rwx rws r-x	1777	d rwx rwx rwt
755	d rwx r-x r-x	4555	- r-s r-x r-x
750	d rwx r-x ---	711	- rwx --x --x
700	d rwx --- ---	711	d rwx --x --x

File Access Mode (5)

- Assign default permissions: umask
  - Shell built-in command
  - Inference the default permissions given to the files newly created.
  - The newly created file permission:
  - Use full permission bit (file: 666, dir: 777) & (!umask) value.
  - Ex:

umask	New File	New Dir
022	- rw- r-- r--	d rwx r-x r-x
033	- rw- r-- r--	d rwx r-- r--
066	- rw- --- ---	d rwx --x --x
000	- rw- rw- rw-	d rwx rwx rwx
277	- r-- --- ---	d r-x --- ---
777	- --- --- ---	d --- --- ---

File Protection

Command	Minimum Access Needed	
	On file itself	On directory
cd /home/test		x
ls /home/test		r
ls -s /home/test/*.c		rx
cat runme	r	x
cat >> runme	w	x
run-binary	x	x
run-script	rx	x
rm rumme		wx

Changing File Owner

- Changing File Owner
  - Commands:
    - chown(8) -- change user owner
    - chgrp(1) -- change group owner
- Change the file ownership and group ownership

```
$ chown -R tsaimh /home/tsaimh
$ chown -R tsaimh:dcs /home/tsaimh
$ chown -R :dcs /home/tsaimh
$ chgrp -R dcs /home/tsaimh
```

FreeBSD bonus flags (1)

- chflags(1) command
  - schg system immutable flag (root only)
  - sunlnk system undeletable flag (root only)
  - sappnd system append-only flag (root only)
  - uappend user append-only flag (root, user)
  - uunlnk user undeletable flag (root, user)
- ls -ol

```
$ ls -ol /libexec/
total 1034
-r-xr-xr-x  1 root  wheel  schg    238472 Sep 21 12:50 ld-elf.so.1*
-r-xr-xr-x  1 root  wheel  -       238512 Jul 24 17:15 ld-elf.so.1.old
-r-xr-xr-x  1 root  wheel  schg    212204 Sep 21 12:51 ld-elf32.so.1
-r-xr-xr-x  1 root  wheel  -       212248 Jul 24 17:17 ld-elf32.so.1.old
```

FreeBSD bonus flags (2)

```
$ ls -al > file
$ chflags uappend file
$ ls -al > file
file: Operation not permitted.
$ ls -al >> file
$ ls -ol
total 2
-rw-r--r--  1 tsaimh  dcs  uappnd 325  9  4 16:14 file
$ cat file
total 8
drwxr-xr-x   2 tsaimh  dcs   512  9  4 16:13 .
drwxr-xr-x  49 tsaimh  dcs  4608  9  4 16:13 ..
-rw-r--r--   1 tsaimh  dcs     0  9  4 16:13 file
total 10
drwxr-xr-x   2 tsaimh  dcs   512  9  4 16:13 .
drwxr-xr-x  49 tsaimh  dcs  4608  9  4 16:13 ..
-rw-r--r--   1 tsaimh  dcs   162  9  4 16:13 file
```

Appendix

Department of Computer Science and Information Engineering, NCKU

Journaling File System

- Write operational logs to the journal first, then commit it asynchronously.
- If system crashed, check the log
  - fully committed: skip
  - partial committed: rollback or commit
  - non-committed: ignore or commit
- Reduce "fsck" time and data inconsistency
- Example
  - ext3, ext4
  - xfs
  - btrfs

CoW (Copy on Write) File System

- If some data is copied but not modified, they will be referred to the same physical address in the storage
- Pros
  - Reduce the space used
  - Low cost snapshots
- Cons
  - Data inconsistency (for example, the reference count is not consistent)
  - Not "real" used space on file
- Example
  - ZFS deduplication

File Attribute Extension

- Associate files with metadata not interpreted by the filesystem
- Key-value pairs, saved in the inode
- Example
  - mime_type
  - md5/sha1 checksum
  - security attributes
